

# STATIONS AND INSTRUMENTS

## ABSTRACT

This report presents a comprehensive overview of measurement stations operated by KACARE. These stations are crucial for gathering data pertaining to solar and wind energy, providing essential insights into renewable energy potential and environmental conditions. The report outlines the description, locations, and instrumentation utilized in both solar and wind measurement stations.

## Solar stations Overview

KACARE's coordinated network of solar resource monitoring stations deployed starting from 2013 is now characterizing the spectral, spatial, and temporal variability of the resource, including the impact of aerosols. Collectively, the stations characterize the three components of solar radiation (direct normal irradiance [DNI], global horizontal irradiance [GHI], and diffuse horizontal irradiance [DHI]), plus related meteorological and dust parameters.

Two Tiers of solar resource monitoring stations, defined by the types and quantities of instrumentation, have been established to address the needs for acquiring data that will capture the spatial and temporal variability of solar resources throughout the Kingdom, as follows:

### Tier 1 - Research Stations

This station tier is the most complete and complex of the monitoring systems, and provides the highest quality (lowest uncertainty) data, in the range of +/- 2% (sub-hourly). All Tier 1 stations comply with the measurement practices described in the World Meteorological Organization (WMO) Baseline Surface Radiation Network (BSRN) Operations Manual. Tier 1 stations are checked and cleaned on a daily schedule, and provide 1-minute level data (averaged to hourly data and above). Three configurations of Tier 1 stations are being deployed:

- **Configuration A - Research and Development Laboratory.** This configuration contains the full complement of radiometric instruments with independent and redundant solar radiation component data, plus basic meteorological instruments and instruments measuring dust deposition and horizontal visibility.
- **Configuration B - Solar Broadband and Spectral Monitoring Station.** This configuration containing all broadband solar radiometers, selected solar spectral radiometers and photometers, pyrgeometers, and basic meteorological instruments, plus instruments measuring dust deposition and horizontal visibility.

- **Configuration C - Broadband Baseline Monitoring Station.** This configuration contains instrument systems providing fundamental broadband solar irradiances (DNI, GHI, DHI, and GTI), plus basic meteorological instruments.

## Tier 2- Mid-Range Stations

Based on the installation of a rotating shadowband radiometer (RSR), this station configuration produces fundamental solar resource and surface meteorological data. RSRs provide data with base uncertainty of +/- 5% (sub-hourly) plus additional uncertainty for cleaning intervals and quality checks, when properly operated. Tier 2 stations are checked and cleaned on a twice-weekly schedule, and provide 1-minute level data (averaged to hourly data and above).

All instruments are calibrated and maintained according to the manufacturer's specifications.

## Solar Monitoring Network Stations

Province	City	Station Name	Station Abbreviation	Station Type (Tier)
Al Bahah	Al Bahah	Al Bahah University	Al Bahah - University	1C

## Wind stations Overview

Since 2014, the Measurement Network program in King Abdullah City for Atomic and Renewable Energy consisting of 10 wind ground measurement stations was put in operation to assess and quantify wind potential in the kingdom. They provide high-quality wind assessment and meteorological information. The stations are operated and maintained on a rigorous schedule, under the supervision of K.A.CARE, and in partnership with universities, technical colleges and institutes, and government agency partners.

The wind Measurement Network today consists of 100-meter steel towers equipped with 6 cup anemometers and 3 wind vanes that measure the wind speed and wind direction at 40 m, 60 m, 80 m, and 100 m. Additionally, a barometer and a thermo-hydro-sensor to measure the air pressure, temperature, and relative humidity are installed.

## Wind Monitoring Network Stations

Province	City	Station Name
